Waves Complete 05-2018 Crack Download Online Full Version VST Mac Download on microtubule inhibitors is the therapy of refractory leukaemia. Promising results have been achieved with several microtubule inhibitors in leukaemia therapy. The most successful compounds include thiosemicarbazones, colchicine, vinca alkaloids and epothilones. Epothilones were originally discovered in the 1960s as microtubule inhibitors isolated from the natural source *S. mexicana*[@b31]. The mechanism of action of these compounds is still not clearly understood, however, they are capable of interfering with the dynamic equilibrium of the microtubule system. Recent data shows that the epothilone derivative, ixabepilone, is capable of inhibiting growth and inducing apoptosis of leukaemic cells even in the absence of normal haematopoietic support[@b32]. We have shown that epothilone A binds to the same colchicine binding site on tubulin as paclitaxel, nocodazole and vinblastine[@b33]. Epothilone A interferes with microtubule dynamics by inhibiting the polymerization of tubulin[@b34]. This effect is likely to be the basis for its *in vivo* anti-tumour activity as it has been demonstrated that inhibition of microtubule polymerization results in inhibition of tumour growth[@b35]. Since epothilone A does not inhibit the function of the mitotic spindle, a major requirement for most chemotherapeutic agents[@b36], it is evident that the cytotoxicity induced by this compound is not related to spindle assembly or function. This explains why epothilone A was active against multidrug resistant cells in which P-gp plays a major role in resistance. Conclusion ===== In this study we showed for the first time that epothilone A, a natural product, is capable of inhibiting growth and inducing apoptosis of human leukaemic cells. The mechanism of this activity is different from the activity of epothilone B which is a synthetic derivative of the natural product and is currently undergoing clinical trials. The effects of epothilone A are sensitive to the P-gp efflux pump and the MAPK pathway. These results indicate that epothilone A can be used in combination with other
