Calculation for a life insurance  
premium I have a basic question  
about life insurance premium

---

calculations. I am in Australia and my occupation is self employed (Self employed life insurance). The class of risk my policy is under is - Standard(X) Sis (L) 49). If I did a calculation on my current policy of (excluding the medicare levy) - 10% (3000) + 2% (400) + 5% (600) = \$3875 If I do a calculation for a new policy (same class of risk) - 10% (3000) + 2% (400) + 5% (600) = \$4270. My question is why does the new policy cost more? Shouldn't the premiums in both case be the same?

---

Thanks A: Your calculation is wrong. \$1.35 isn't 10% of \$3,000. The risk is \$3,000, not  $\$3,000 \times 10\%$ . The rates are the same. So you end up with \$3875.00, not \$4270.00.

Q: On the optimization of k-anonymity: which applications would benefit from this? Do you know any application using k-anonymity? I am wondering if there is a big need to care about k-anonymity (and the resulting "k-anonymous" data sets). A: I'm not sure I can say whether any particular

---

company is using K-anonymity, but I know that for at least two companies (StartOut and Casper Data) that provide a K-anonymized data service to anonymize user data for research purposes. These companies are based in the US. My experience is that organizations that find themselves needing to comply with data privacy laws use K-an

CCNA Routing and Switching Lab:  
Hacking The CCNA Routing and Switching Lab: Hacking the Layer 2

---

Switch (SSH) is designed to test your ability to deploy, configure, and debug a small Layer 2 switch using the Secure Shell (SSH) protocol.

Dumps of the CCNA Routing and Switching Lab: Hacking The CCNA Routing and Switching Lab: Hacking the Layer 2 Switch (SSH) certification exam dumps can be used for questions and answers. This 5-day instructor-led live training course is designed for IT professionals who want to learn and deploy IP routing protocols such as
