file. If your artwork is based on a template, you can use i2 to import a new shape or image to the design and then align it to a specific point of the template. The resulting image will automatically be saved into the correct location in the project file. In this way, you can create and manipulate layers that contain multiple shapes and images. i2 will also be able to change the color of a shape or image. This makes it possible to create files in which any color, font, and background can be customized. To import an image into your project file, you can select the image from the image library and drag it to the design. i2 will then open the file and help you to find the path of the image. Once you have found the right path, you can close the image library. To import an image from the Internet, go to the Places tab and select it from the Web folder. You can also find it in a folder on your computer. Simply select the image and click Import. You can save an 2d92ce491b
