ISP An Internet Service Provider (ISP) is a company that provides Internet access to its customers over a telephone, cable, or fiber-optic network. The data link connection between the access point and the IP router is known as the upstream connection. The Internet connection between the access point and the IP router is known as the downstream connection. IP address An IP address is a number assigned to each computer or other network device connected to a network. Network A computer network or a network is a telecommunications network that uses a structured set of protocols to link two or more computers, mobile or fixed, and allow them to communicate with each other. A network is a connection of many individual networks. It is a collection of computers and devices connected together with shared resources. The Internet is an Internet protocol (IP) based network. IP address An IP address is a number assigned to each computer or other network device connected to a network. IP router An Internet Protocol router is a device that is used to direct packets of data to their destination. NAP A network access point (NAP) is a device which allows access to a network through wired and wireless connections. NAT Network address translation (NAT) is a protocol used to map one or more private networks behind one or more public networks. Network address translation (NAT) is a protocol used to map one or more private networks behind one or more public networks. Network Address Translation (NAT) – Wikipedia, the free encyclopedia. The Network Address Translation (NAT) protocol works by redirecting IP addresses and port numbers to external IP addresses and port numbers. For example, a computer might have an internal IP address of 1.1.1.1 and a port number of 22. An external address and port number might be 2.2.2.2 and 442
