## Fsdreamteam Gsx Ground Services X Crack EXCLUSIVE

Fsdreamteam Gsx Ground Services X Crack Category:Simulation video game developersQ: How to remove duplicates where column 1 and 2 are equal? I have a dataframe where one of the columns is a unique identifier for every data point. import pandas as pd df = pd.DataFrame({'MyID':[1,2,2,2,3,3,4], 'name':['John','Mary','Mary','Mary','Eric','Jane','Jane']})

```
df.drop_duplicates(subset=['MyID','name'],inplace=True,keep='last')
```

MyID name 0 1 John 1 2 Mary 3 2 Mary

Mary I would like to get rid of the duplicate MyID but keep the duplicate name. MyID changes on a regular basis but name never changes, I would like to keep the last value of name. I've tried a number of methods on stack overflow but can't seem to get it to work. A: use set as index df.reset\_index(drop=True) Out[634]:

```
MyID name 0 1 John 1 2 Mary 3 2 Mary
```

EDIT: if you want to drop the row

```
df.drop_duplicates(subset=['MyID','name'],keep='last')
```

Out[637]: MyID name 0 1 John 1 2 Mary A: I think you can assign values with replace parameter, last parameter means default value for missing values: print (df)

```
MyID name 0 1 John 1 2 Mary 2 2 Mary 3 3 Eric 4 3 Jane 5
```
