The muscle strength of the thigh and knee increases with age, and studies have shown that isometric strength of the knee muscles tends to decrease more than that of the thigh muscles with weight gain. However, it is not known how the isometric strength of different thigh and knee muscles, e.g., quadriceps and hamstrings, changes with weight change. The purpose of this study was to investigate whether isometric strength of the thigh and knee muscles and which muscles of the thigh and knee are affected by weight gain. Twenty-seven healthy young adults were recruited for this study. The measurements of isometric strength were obtained from the thigh and knee, and were repeated after 8-12 weeks. The isometric strength of the knee extensors increased significantly with weight gain in both groups ( $p = 0.001$ ). The isometric strength of the knee flexors, however, decreased significantly with weight gain in the group with weight gain ( $p = 0.03$ ). The thigh extension isometric strength of the thigh muscles decreased significantly in the group with weight gain ( $p = 0.03$ ). The thigh flexion isometric strength of the thigh muscles decreased significantly in the group with weight gain ( $p = 0.03$ ). The isometric strength of the knee extensors and hamstrings increased with weight gain, but the isometric strength of the thigh flexors and quadriceps decreased with weight gain. These findings suggest that weight gain may affect muscle quality of the thigh and knee. This specification relates to performing mobile searches. The Internet provides access to a wide variety of resources, for example, web pages, images, audio files, video files, and other resources. Each resource is typically identified by a unique address or uniform resource locator (URL). Many resources are initially accessible only to Internet users located within a particular domain. Access to such resources requires the user to first access the domain that provides the resource and be authenticated before gaining access to the resource. Access to the domain is typically controlled by a domain name server. Thus, each domain can include multiple resources. Each resource 2d92ce491b
