In fact, we can assume without loss of generality that $f(0) = 0$ and $f(1) = 1$. Does complex analysis still hold in general when considering f ? That is, does it hold that for any two points z_1 and z_2 on the unit circle, there is a linear fractional transformation A such that $A(z_1)$ and $A(z_2)$ are either both inside the unit disk or both outside of the unit disk, but at least one is inside and at least one is outside? A: Yes, but the proof is not really that simple. For example, the argument principle still works. Let γ_j be a closed path in the unit disk, and let I be the set of points z in the unit disk such that $f(z)$ is not in γ_j . Then I is a closed subset of the unit disk, hence compact. Let ζ_j be the images
