Category:Structural engineering Category:Winds Category:Structural analysisQ: How to get data from ajax request in React? I'm trying to retrieve the data from an ajax request in React. The ajax request is called when a user clicks on a button. I'm passing the id of the users from the route. However, when the ajax request is made, the response is empty. I did try this: componentDidMount() { const { id } = this.props.match.params; axios.get(`/api/v1/logs/\${id}`) .then(res => this.setState({ api: res.data })) .catch(err => console.log(err)); } EDIT: My current solution was to use componentWillMount like this: componentWillMount() { const { id } = this.props.match.params; const user = axios.get(`/api/v1/user/\${id}`) .then(res => this.setState({ user, api: res.data })) .catch(err => console.log(err)); } A: You're using const to bind the id to the props that you received from the render, but the id is not defined yet. If your component is not stateful you can define the id in the constructor constructor(props) { super(props); this.id = props.match.params.id; } and use the id anywhere you need 2d92ce491b
