The estimated size of the book is .1. Field of the Invention The present invention relates to an input device and an image forming apparatus. 2. Description of the Related Art In order to increase the reliability of an input device such as a key or a touch panel or a display panel and a liquid crystal panel, a technique has been widely used in which each of a plurality of light-emitting diodes (LEDs) is independently driven to detect the light amount of a lighting LED lighted in accordance with the ON/OFF state of a touch operation on the key or touch panel. In this technique, the light amount detected at the time of ON state is compared with the threshold, and a determination is made on whether or not the light amount detected at the time of ON state is greater than or equal to the threshold. Further, the technique has been widely used in which each of the plurality of LEDs is independently driven to detect the light amount of each of the LEDs, and a determination is made on whether or not the light amount detected at the time of ON state is greater than or equal to the threshold. In the above-mentioned technique, the determination of the light amount or the light amount itself may be erroneously made on the basis of noise or a fluctuation in a dark portion of the image displayed on the liquid crystal panel, and thus the reliability of the input device may be lowered. Therefore, Japanese Patent Application Laid-open No. 2010-197802 discusses a technique in which the number of times of determination, the threshold, or a weighting factor of the light amount for the determination is adjusted based on a result of determination of the presence 2492ce491b
