OpenJPEG is a JPEG 2000 codec written in C language and licensed under the GNU General Public License (GPL). The OpenJPEG library supports all the JPIP standards (JPIP1, JPIP2, JPIP3) and provides a set of tools to manipulate the images and manage the files. The library provides the features: - JPEG 2000 decoding, including the high-level JPIP protocol decoding - JPEG 2000 encoding, including the high-level JPIP protocol encoding - JPEG 2000 decoder functionality: manipulate the JPEG 2000 datastream - JPEG 2000 encoder functionality: manipulate the JPEG 2000 datastream - Support for j2k-files - Support for xxx-files - JPEG 2000 Error resilient decoding - JPEG 2000 Error resilient encoding - JPEG 2000 decoder functionality: error resilience - JPEG 2000 encoder functionality: error resilience - Tools to handle jpip images - Java-viewer for jp2k-images - java-programming-library - example programs Currently openJPEG is available under the GPL. You can find the code on the web. There are also pre-compiled package for Linux available. See your distribution's package-manager, or visit the download page. OpenJPEG Specifications: 1) OpenJPEG is written in C language, thus it requires a C++ compiler (GNU C++ 3.2, MinGW, GNU C++ 4.3). To build OpenJPEG, first download and unzip the source code. 2) OpenJPEG can be configured and compiled on a Unix-like (Linux, SunOS, Solaris, FreeBSD), or a Windows platform. The following is a list of requirements for building the project. - JDK 1.4 or higher (1.5, 1.6 are not supported yet) - gcc/g++ 3.2 or higher - Java Development Kit 1.5 or higher - A Unix/Linux build-enviroment that has enough free memory for building (we recommend 10 to 20 Mb). 3) You can configure OpenJPEG with the following options, or you can build OpenJPEG with other options. - by default, OpenJPEG is configured to produce executable files on all Unix/Linux platforms and programs linked with the shared libraries on Windows - for Win32, you need the gcc with the following flag:

OpenJPEG includes a reference implementation of the JPEG 2000 Part1, Part2 and Part3 codecs as well as an implementation of the JPIP protocol. See for more information. The OpenJPEG library was designed to be an open-source JPEG 2000 codec written in C language. It has been developed in order to promote the use of JPEG 2000, the new still-image compression standard from the Joint Photographic Experts Group (JPEG). In addition to the basic codec, various other features are under development, among them the JP2 and MJ2 (Motion JPEG 2000) file formats, an indexing tool useful for the JPIP protocol, JPWL-tools for error-resilience, a Java-viewer for j2k-images,. What's New In OpenJPEG?

OpenJPEG is a collection of libraries written in C programming language that implements and extends the JPEG 2000 still-image compression standard. The current version of the library is based on a recent OpenJPEG 1.2.0 core, and has been enhanced to support the JPIP (Joint Photographic Image Coders) digital imaging protocol. The library uses the industry-standard zlib library and the associated zlib license, so there is no licensing problem. The OpenJPEG library has been developed for platform-independent use on any UNIX-like system, on OS/2, on Windows, on PowerPC, and on other platforms. This application has an IJG-patented packet data compression library that is written in C language and uses zlib for the underlying data compression. IJG's jpeg and jpeg-bak (II) utilities are used for pre- and post-processing of input images. IJG's zlib is used to produce the pnm file format used by the IJG-patented FUJI-JRPG (Fuji GIF RPG) file format. IJG's libjpg was written to use the openjpeg library, but libjpg may be used with other commercial JPEG encoders and decompressors. JMPG2Viewer is a Java image viewer designed for viewing JPEG 2000 encoded images, and particularly the images in the JMPG2 format. The JMPG2 format (JPEG 2000 Image Format) is an application of JPEG2000 technology to the field of still images. JMPG2 is designed to support digital images in the range of resolution, color depth, and color quality, which is suitable for documents, graphics, web pages, and medical images. The JMPG2 format uses the same image coding and decoding algorithms as the JPEG2000 standard, and was therefore originally designated as JPEG2000 for still images. The JMPG2 format is based on the new JPEG2000 standard, and was selected to be compatible with the JPEG2000 specification. The JMPG2 format is also based on the ISO base media file format (ISO/IEC 14495) and is compatible with ISO base media file format (ISO/IEC 14495). The JMPG2 image format uses a variation of the JPEG2000 coding algorithm (JPEG2000-Lossless Part 2) that is designed to retain image quality when reducing the size of the compressed data. The JMPG2 format is designed to be compatible with the OpenJPEG library. JPEG 2000 files in the JMPG2 format can be viewed and saved with the JMPG2Viewer. OpenJPEG Configuration The files libjpeg-8.0.5.tar.gz and libjpeg-8.0.5.tar.gz.sig.asc are available for download.
