. 1771 By the time these essaysÂ . "We don't really have a business model, since we do not sell games." "And how do you plan to recoup your investment on the new devices?" "It's really hard to say." Pereira then put forward his plan for an Apple appstore-like business model, but it seemed that the devices would need to be a lot more flexible than Apple's iPad. "We would not have a good relationship with hardware vendors," Pereira said. "We would end up being too beholden to their hardware choices. I do not want to give an exclusive to anything." In developing the next-gen iOS devices, he planned to use Apple's version of Linux. As a known quantity, Linux would make it easier to develop games. "I had a lot of trouble with the iPhone," Pereira said. "It's a huge mess of C++ and Objective-C and now Swift. That was the worst thing that could have happened to us." Although the iPhone and iPad had a huge success, it wasn't possible to create iPhone games using Objective-C or C++. "Every time I develop an App, I get an error. So it's a lot of work, and I think people are looking for something a little less risky. We are ready to experiment, but if we are not rewarded, then we are not going to be motivated." The downside to these new devices is that it will make these new games a lot more complicated. Another problem is that the cloud won't be available on all hardware. So what happens if we write the equivalent of the California gold rush, but then the gold runs out? "Every publisher will ask what are you doing with the assets once you own the IP, but that is a stupid question." The online world is about to invent an inferior way of doing business, and we will have to adapt to that new reality. The next-gen devices will also create a new internet, which could affect the whole economy. "When the internet was developed, we thought we would become obsolete, but we became more powerful and more useful. In the early days we were just file transfer, but now we are all about location-based services and social services." "We will not be able to maintain the internet infrastructure, the devices, our network routers, or make sure they
