Technical details AutoCAD 2013, 2014, 2015, 2016 and 2017 are built on the Windows client application framework. As is the case with all Windows applications, AutoCAD is a 32-bit application, which runs on the 64-bit Windows platform. The programming languages used for scripting are AutoLISP, Visual LISP and Microsoft's Visual Basic. The LISP programming language is a dialect of the Lisp programming language. AutoCAD LISP is loosely based on the Common Lisp programming language. The official LISP programming language is available from Autodesk, and can be used to access any data available to AutoCAD and draw 2D and 3D objects. The other two languages are the built-in Visual Basic and Visual LISP. Visual Basic is a general-purpose programming language developed by Microsoft that is used for Windows applications. Visual LISP is a general-purpose programming language developed by the Autodesk engineering division for building automation systems. Both languages can be used to access any data available in AutoCAD, draw 2D and 3D objects, and manipulate those objects. Visual LISP, the primary programming language used in AutoCAD, is an interpreted language, which means that the programmer defines the scope of the procedure, and this definition is processed before the actual procedure executes. Visual LISP is easy to learn but more difficult to master. Visual Basic, which is also available in AutoCAD, is similar to Visual LISP in that the programmer defines the scope of the procedure, and this definition is processed before the actual procedure executes. However, Visual Basic provides the functionality of compiling the code, which means that the code is compiled before it executes. AutoCAD's LISP system allows the programmer to write scripts using any scripting language, including AutoLISP. AutoCAD provides built-in scripting for two main data types: DWG and RDL files. When customizing AutoCAD, engineers, architects and interior designers can use the Visual LISP to work with the drawings they have created using AutoCAD as well as to automate their work processes. However, this process is time-consuming and requires a high level of programming knowledge. Another disadvantage is the lack of support for the 2D drawings made using the Windows drawing application. To automate the drawing and drawing table creation process, AutoCAD uses a Python scripting language that can be used in conjunction with the Visual L. 5b5f913d15
